

MR Ankle wo Left

* Final Report *

Result date: 24 September 2012 7:18 EDT
Result status: Auth (Verified)

* Final Report *

Reason For Exam
OSTEOMYELITIS

REPORT
MR LEFT ANKLE:

HISTORY: OSTEOMYELITIS

COMPARISON: None.

TECHNIQUE: Multiplanar images of the left ankle were obtained at 1.5 Tesla without IV contrast.

FINDINGS:

BONES: No areas of abnormal bone marrow signal are present. No fracture or cortical erosion is seen. There are mild degenerative changes of the tibiotalar joint. There are small calcaneal bone spurs at the Achilles' tendon and plantar fascia insertion. No osteochondral injury is seen.

TENDONS: The flexor and extensor tendons are intact. The Achilles tendon and plantar fascia are intact.

LIGAMENTS: No evidence of ligament rupture is seen. The collateral ligaments are intact.

SOFT TISSUES: There may be a medial heel ulceration. There is adjacent subcutaneous edema. No soft tissue abscess is present.

IMPRESSION: Probable healed ulceration without evidence of soft tissue abscess or osteomyelitis.
